A New Vision for Science Education	4
Three Dimensions of the Next Generation Science Standards (NGSS) Science and Engineering Practices, Disciplinary Core Ideas, Crosscutting Concepts, Connections to the Nature of Science	5-7
Science Inquiry	8
Unit 1: The Study of Energy and Energy Transfer	9-18
Unit 2: The Study of Earth's Systems and Human Impact	19-33
Unit 3: The Study of Life: Structure and Function	34-45
Unit 4: The Study of Genetics	46-55
Appendix	

District Philosophy
Ledyard's vision for K-12 inquiry based science is to engage students in scientific and engineering practices as they apply crosscutting concepts to deepen their understanding of the core ideas in these fields.

A New Vision for Science Education

Implications of the Vision of the Framework for K-12 Science Education and the Next Generation Science Standards

SCIENCE EDUCATION WILL INVOLVE LESS:	SCIENCE EDUCATION WILL INVOLVE MORE:
Rote memorization of facts and terminology.	Facts and terminology learned as needed while developing explanations and designing solutions supported by evidence-based arguments and reasoning.
Learning of ideas disconnected from questions about phenomena.	Systems thinking and modeling to explain phenomena and to give a context for the ideas to be learned.
Teachers providing information to the whole class.	Students conducting investigations, solving problems, and engaging in discussions with teachers' guidance.
Teachers posing questions with only one right answer.	Students discussing open-ended questions that focus on the strength of the evidence used to generate claims.
Students reading textbooks and answering questions at the end of the chapter.	Students reading multiple sources, including science-related magazine and journal articles and web-based resources; students developing summaries of information.
Pre-planned outcome for “cookbook” laboratories or hands-on activities.	Multiple investigations driven by students’ questions with a range of possible outcomes that collectively lead to a deep understanding of established core scientific ideas.
Worksheets.	Student writing of journals, reports, posters, and media presentations that explain and argue.
Oversimplification of activities for students who are perceived to be less able to do science and engineering	Provision of supports so that all students can engage in sophisticated science and engineering practices

Scientific and Engineering Practices Matrix

Asking Questions and Defining Problems

A practice of science is to ask and refine questions that lead to descriptions and explanations of how the natural and designed world works and which can be empirically tested.

Engineering questions clarify problems to determine criteria for successful solutions and identify constraints to solve problems about the designed world. Both scientists and engineers also ask questions to clarify the ideas of others.

Planning and Carrying Out Investigations

Scientists and engineers plan and carry out investigations in the field or laboratory, working collaboratively as well as individually. Their investigations are systematic and require clarifying what counts as data and identifying variables or parameters. Engineering investigations identify the effectiveness, efficiency, and durability of designs under different conditions.

Analyzing and Interpreting Data

Scientific investigations produce data that must be analyzed in order to derive meaning. Because data patterns and trends are not always obvious, scientists use a range of tools—including tabulation, graphical interpretation, visualization, and statistical analysis—to identify the significant features and patterns in the data. Scientists identify sources of error in the investigations and calculate the degree of certainty in the results. Modern technology makes the collection of large data sets much easier, providing secondary sources for analysis.

Engineering investigations include analysis of data collected in the tests of designs. This allows comparison of different solutions and determines how well each meets specific design criteria—that is, which design best solves the problem within given constraints. Like scientists, engineers require a range of tools to identify patterns within data and interpret the results. Advances in science make analysis of proposed solutions more efficient and effective.

Developing and Using Models

A practice of both science and engineering is to use and construct models as helpful tools for representing ideas and explanations. These tools include diagrams, drawings, physical replicas, mathematical representations, analogies, and computer simulations. Modeling tools are used to develop questions, predictions and explanations; analyze and identify flaws in systems; and communicate ideas. Models are used to build and revise scientific explanations and proposed engineered systems. Measurements and observations are used to revise models and designs.

Constructing Explanations and Designing Solutions

The products of science are explanations and the products of engineering are solutions. The goal of science is the construction of theories that provide explanatory accounts of the world. A theory becomes accepted when it has multiple lines of empirical evidence and greater explanatory power of phenomena than previous theories. The goal of engineering design is to find a systematic solution to problems that is based on scientific knowledge and models of the material world. Each proposed solution results from a process of balancing competing criteria of desired functions, technical feasibility, cost, safety, aesthetics, and compliance with legal requirements. The optimal choice depends on how well the proposed solutions meet criteria and constraints.

Engaging in Argument from Evidence

Argumentation is the process by which explanations and solutions are reached. In science and engineering, reasoning and argument based on evidence are essential to identifying the best explanation for a natural phenomenon or the best solution to a design problem. Scientists and engineers use argumentation to listen to, compare, and evaluate competing ideas and methods based on merits. Scientists and engineers engage in argumentation when investigating a phenomenon, testing a design solution, resolving questions about measurements, building data models, and using evidence to identify strengths and weaknesses of claims.

Using Mathematics and Computational Thinking

In both science and engineering, mathematics and computation are fundamental tools for representing physical variables and their relationships. They are used for a range of tasks such as constructing simulations; statistically analyzing data; and recognizing, expressing, and applying quantitative relationships. Mathematical and computational approaches enable scientists and engineers to predict the behavior of systems and test the validity of such predictions. Statistical methods are frequently used to identify significant patterns and establish correlational relationships.

Obtaining, Evaluating, and Communicating Information

Scientists and engineers must be able to communicate clearly and persuasively the ideas and methods they generate. Critiquing and communicating ideas individually and in groups is a critical professional activity. Communicating information and ideas can be done in multiple ways: using tables, diagrams, graphs, models, and equations as well as orally, in writing, and through extended discussions. Scientists and engineers employ multiple sources to acquire information that is used to evaluate the merit and validity of claims, methods, and designs.

<u>Crosscutting Concepts Matrix</u>		
<u>Patterns</u> Observed patterns of forms and events guide organization and classification, and they prompt questions about relationships and the factors that influence them.	<u>Scale, Proportion, and Quantity</u> In considering phenomena, it is critical to recognize what is relevant at different measures of size, time, and energy and to recognize how changes in scale, proportion, or quantity affect a system's structure or performance.	<u>Energy and Matter: Flows, Cycles, and Conservation</u> Tracking fluxes of energy and matter into, out of, and within systems helps one understand the systems' possibilities and limitations.
<u>Cause and Effect: Mechanism and Explanation</u> Events have causes, sometimes simple, sometimes multifaceted. A major activity of science is investigating and explaining causal relationships and the mechanisms by which they are mediated. Such mechanisms can then be tested across given contexts and used to predict and explain events in new contexts.	<u>Systems and System Models</u> Defining the system under study—specifying its boundaries and making explicit a model of that system—provides tools for understanding and testing ideas that are applicable throughout science and engineering.	<u>Structure and Function</u> The way in which an object or living thing is shaped and its substructure determine many of its properties and functions.
		<u>Stability and Change</u> For natural and built systems alike, conditions of stability and determinants of rates of change or evolution of a system are critical elements of study.

Developed by NSTA based on content from the *Framework for K-12 Science Education* and supporting documents for the *May 2012 Public Draft of the NGSS*

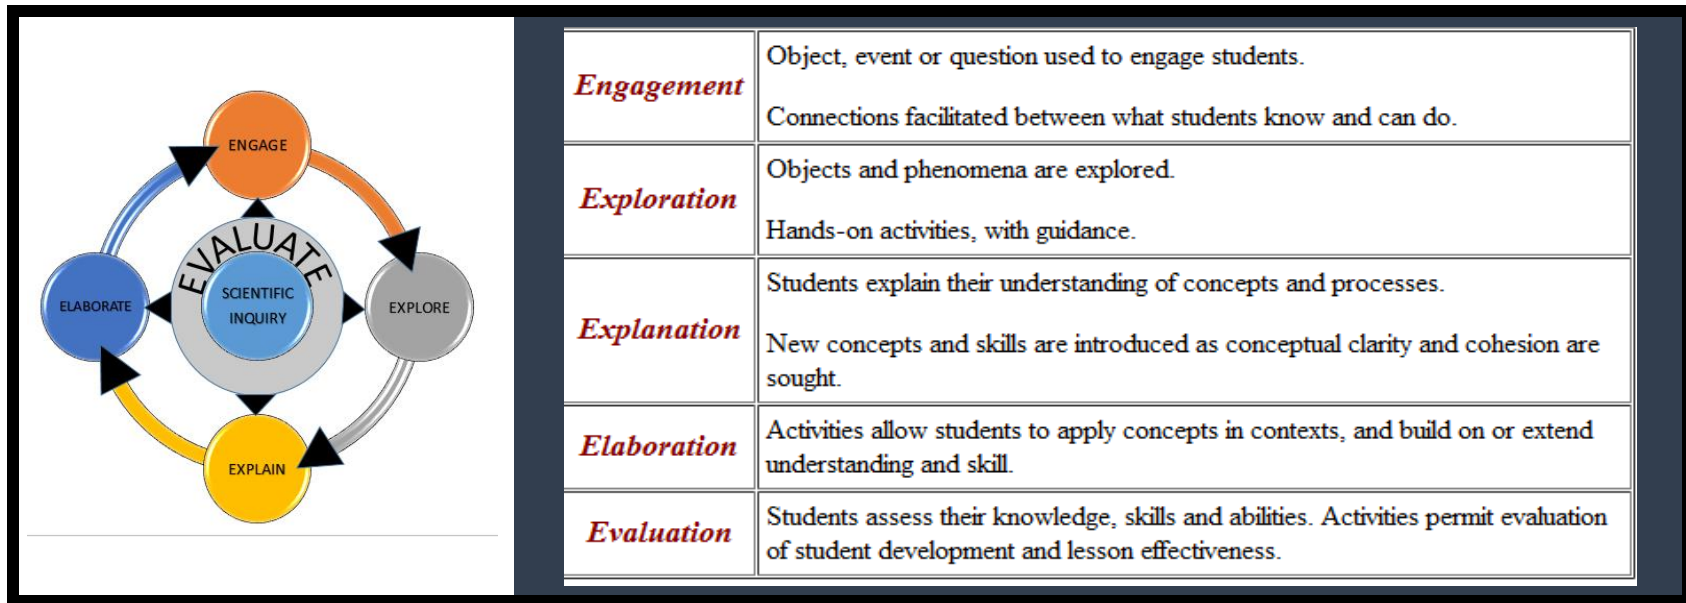

Connections to the Nature of Science

Nature of Science Practices	Nature of Science Crosscutting Concepts
These understandings about the nature of science are closely associated with the science and engineering practices, and are found in that section of the foundation box on a standards page. More information about the Connections to Engineering, Technology and Applications of Science can be found in Appendix H .	These understandings about the nature of science are closely associated with the crosscutting concepts, and are found in that section of the foundation box on a standards page. How does Ledyard Define Inquiry?

Inquiry is defined as a way of seeking information, knowledge, or truth through questioning. Inquiry is a way for a learner to acquire new information and data and turn it into useful knowledge. Inquiry involves asking good questions and developing robust investigations from them. Inquiry also involves considering possible solutions and consequences. A third component of inquiry is separating evidence based claims from common opinion, and communicating claims with others, and acting upon these claims when appropriate. Questions lead to gathering information through research, study, experimentation, observation, or interviews. During this time, the original question may be revised, a line of research refined, or an entirely new path may be pursued. As more information is gathered, it becomes possible to make connections and allows individuals to construct their own understanding to form new knowledge. Sharing this knowledge with others develops the relevance of the learning for both the student and a greater community. Sharing is followed by reflection and potentially more questions, bringing the inquiry process full circle.

Inquiry 5 Science Teaching Model

Ledyard Next Generation Science Standards Grade 6

Unit 1: The Study of Energy and Energy Transfer*August-November*

Anchoring Phenomenon	
<u>Steam powered engine</u> <u>Geothermal energy</u>	
Compelling Questions	Supporting Questions
How can we measure the flow of energy in a system?	<ul style="list-style-type: none"> • <i>How do tiny, moving particles in the atmosphere cause temperature changes all around our planet?</i> • <i>What is energy?</i> • <i>How does energy affect temperature?</i> • <i>How does heat affect matter?</i>
Storyline	Possible Student Misconceptions:
Students will investigate and understand the relationship between heat, temperature and molecules. By the end of the unit, student understanding of thermal energy will guide them in their construction of a device to maintain a specific temperature.	<ul style="list-style-type: none"> • <i>Heat is made up of 'heat' molecules</i> • <i>Only heat, not cold transfers</i> • <i>The mass of atoms or molecules increases with temperature increase, and decreases with temperature decrease</i>

Unit 2: The Study of Earth's Systems and Human Impact

November-March

Anchoring Phenomenon	
<p>Severe weather events can lead to loss of property and/or life. Earth's average temperature is increasing.</p>	
Compelling Questions	Supporting Questions
<p>What is contributing to the rise in global temperature?</p>	<ul style="list-style-type: none"> • <i>How is all of Earth's water recycled?</i> • <i>How does water affect weather as it cycles through Earth's system?</i> • <i>What is wind and what makes it blow?</i> • <i>What are the effects of recent changes in Earth's climate, and how can we address them?</i>
Storyline	Possible Student Misconceptions:
<p>Students will build an understanding about the water cycle, regional climate weather patterns, the rise of global temperature, and the relationship between humans and the environment.</p>	<ul style="list-style-type: none"> • <i>Weather and climate are the same.</i> • <i>Global rising temperatures mean less snow during the winter.</i> • <i>Global changes in temperature happen quickly.</i> • <i>Climate change does not exist or happen.</i>

Unit 2: The Study of Earth's Systems and Human Impact Overview

(MS-ESS2-5) RST.6-8.9 Compare and contrast the information gained from experiments, simulations, video, or multimedia sources with that gained from reading a text on the same topic. (MS-ESS2-5) WHST.6-8.8 Gather relevant information from multiple print and digital sources, using search terms effectively; assess the credibility and accuracy of each source; and quote or paraphrase the data and conclusions of others while avoiding plagiarism and following a standard format for citation. (MS-ESS2-5) <u>Mathematics</u> – MP.2 Reason abstractly and quantitatively. (MS-ESS2-5) 6.NS.C.5 Understand that positive and negative numbers are used together to describe quantities having opposite directions or values (e.g., temperature above/below zero, elevation above/below sea level, credits/debits, positive/negative electric charge); use positive and negative numbers to represent quantities in real-world contexts, explaining the meaning of 0 in each situation. (MS-ESS2-5)	
Lesson Level Vocabulary: <i>atmospheric pressure, density, sea level, barometer, wind, anemometer, convection cell, prototype</i>	
DCI Domain Vocabulary: Domains are bold: <ul style="list-style-type: none"> Earth's Systems → The Roles of Water in Earth's Surface Processes; Weather and Climate (ESS2) <i>accuracy, air mass, air mass circulation, alternative, altitude, atmospheric, atmospheric circulation, average, biosphere, carbon dioxide, chemical, climate change, climatic pattern, condensation, constrain, content, convection cycle, Coriolis effect, crystal, cyclical, density, deposition, determinate, dissolve, distribution, dynamic, evaporation, geographic, geography, geological, gradual, groundwater, high pressure, human activity, humidity, hydrologic cycle, intensity, land distribution, latitude, latitudinal, longitude, longitudinal, low pressure, mass, mechanical, melting point, mineral, molecular, ocean circulation, oceanic, orbit, orientation, percentage, percolation, polar ice caps, pressure, probabilistic, redistribute, reservoir, rock cycle, salinity, solar, store, tectonic, tectonic cycle, tilt, time scale, transfer, transmit, transpiration, unequal heating of air, unequal heating of land masses, unequal heating of oceans, universal solvent, volcanic ash cloud, water cycle, weather map, wetland</i> 	

Performance Expectation MS-ESS2-6 Earth's Systems	
<p>Students who demonstrate understanding can:</p> <p>Develop and use a model to describe how unequal heating and rotation of the Earth cause patterns of atmospheric and oceanic circulation that determine regional climates.</p> <p>Clarification Statement: Emphasis is on how patterns vary by latitude, altitude, and geographic land distribution. Emphasis of atmospheric circulation is on the sunlight-driven latitudinal banding, the Coriolis effect, and resulting prevailing winds; emphasis of ocean circulation is on the transfer of heat by the global ocean convection cycle, which is constrained by the Coriolis effect and the outlines of continents. Examples of models can be diagrams, maps and globes, or digital representations.</p> <p>Assessment Boundary: Assessment does not include the dynamics of the Coriolis effect</p>	
<p>Lesson Level Photo Analysis: Connecticut temperatures (shoreline vs inland) (locate a map showing isotherms for the state of Connecticut)</p> <p>Lesson Level Phenomenon Video: Some places are windy, some are not. Earth's surface is warmer at the equator than at its poles. The sooty shearwater's migration follows the same figure-eight pattern each time. The local climates on either side of a mountain are different.</p> <p><i>*note: all photo and video above links to suggested activities below</i></p>	
MS-ESS2-6 Suggested Activities	MS-ESS2-6 Recommended Formative Assessments
<p>Air Pressure and Wind (TCI Weather and Climate: Unit 2 Weather, Lesson 4) Students will construct an anemometer investigate atmospheric pressure and wind, how they are measured, and how they affect and determine changes in the weather. (4-5 class periods)</p> <p>Supplemental BBC VIDEO (4 mintues)</p> <p>Severe Weather Action Plan (TCI Weather and Climate: Unit 2 Weather, Performance Assessment) Students will develop a weather action plan to mitigate the effects of severe weather in Ledyard (2-3 class periods)</p> <p>Climate Patterns (TCI Weather and Climate: Unit 3, Lesson 8) Students will explain why Earth's temperature differs at the poles and at the equator as they identify the difference between weather and climate and examine climographs. (4-5 class periods)</p> <p>Global Circulation of the Atmosphere (TCI Weather and Climate: Unit 3, Lesson 9) Students will create a classroom model of the Coriolis Effect and identify global wind patterns to plot routes for a shipping company. (3-4 class periods)</p> <p>How the Oceans Affect Climates (TCI Weather and Climate: Unit 3 Climate, Lesson 10) Students will make a plan to monitor ocean temperatures using buoys and create a model of the global circulation and flow of energy of the ocean. (5-6 class periods)</p>	<ul style="list-style-type: none"> • Develop an initial model and revise the model depicting onshore and offshore breezes and their affect on land temperature. • Write a list of recommendations to the Town Council to alert Ledyard citizens of severe weather. • Design and test a microclimate for plants collaboratively, and present to the class.

MS-ESS2-6 Suggested Activities		MS-ESS2-6 Recommended Formative Assessments	
<p>Local Climate (TCI Weather and Climate: Unit 3, Lesson 11) Students will explore the effects of albedo, and use climographs to explain different climate differences in similar locations. (2-3 class periods)</p> <p>Designing a Microclimate (TCI Weather and Climate: Unit 3 Climate, Engineering Challenge) Students will design and develop a growth system that maintains its own microclimate for a plant not native to our local environment. (2-3 class periods)</p>		*See above	
Science and Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts	
<p>Developing and Using Models</p> <ul style="list-style-type: none"> Develop and use a model to describe phenomena. <p>Modeling in 6–8 builds on K–5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.</p>	<p>ESS2.C: The Roles of Water in Earth's Surface Processes</p> <ul style="list-style-type: none"> Variations in density due to variations in temperature and salinity drive a global pattern of interconnected ocean currents. <p>ESS2.D: Weather and Climate</p> <ul style="list-style-type: none"> Weather and climate are influenced by interactions involving sunlight, the ocean, the atmosphere, ice, landforms, and living things. These interactions vary with latitude, altitude, and local and regional geography, all of which can affect oceanic and atmospheric flow patterns. The ocean exerts a major influence on weather and climate by absorbing energy from the sun, releasing it over time, and globally redistributing it through ocean currents. 	<p>Systems and System Models</p> <ul style="list-style-type: none"> Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.

<p><i>Students who demonstrate understanding can:</i></p> <p>Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms.</p> <p>Clarification Statement: Examples of local environmental conditions could include availability of food, light, space, and water. Examples of genetic factors could include large breed cattle and species of grass affecting growth of organisms. Examples of evidence could include drought decreasing plant growth, fertilizer increasing plant growth, different varieties of plant seeds growing at different rates in different conditions, and fish growing larger in large ponds than they do in small ponds</p> <p>Assessment Boundary: <i>Assessment does not include genetic mechanisms, gene regulation, or biochemical processes.</i></p>		
<p>Lesson Level Phenomenon Video: Humans have opposable thumbs but turtles do not.</p> <p><i>*note: all photo and video above links to suggested activities below</i></p>		
MS-LS1-5 Suggested Activities		MS-LS1-5 Recommended Formative Assessments
<p>Traits for Survival (TCI: Cells and Genetics Unit 1, Lesson 1) Students will observe and identify specialized survival traits. They will research plants and animal traits and compile their findings in a data chart. Students will research an organism of their choice, focusing on specialized survival traits. (4-5 class periods)</p>		<ul style="list-style-type: none"> Complete Trait Trek to Madagascar (TCI Performance Assessment) Use Google Map Trek to create a digitally planned route with four stops identifying one or more organisms and their specialized survival/reproduction traits.
Science and Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
<p>Constructing Explanations and Designing Solutions</p> <ul style="list-style-type: none"> Construct a scientific explanation based on valid and reliable evidence obtained from sources (including the students' own experiments) and the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future. <p>Constructing explanations and designing solutions in 6–8 builds on K–5 experiences and progresses to include constructing explanations and designing solutions supported by multiple sources of evidence consistent with scientific knowledge, principles, and theories.</p>	<p>LS1.B: Growth and Development of Organisms</p> <ul style="list-style-type: none"> Genetic factors as well as local conditions affect the growth of the adult plant. 	<p>Cause and Effect</p> <ul style="list-style-type: none"> Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Performance Expectation	
MS-LS1-5 From Molecules to Organisms: Structure and Processes	
Connections to other DCIs in Middle School: MS.LS2.A	
Articulation of DCIs across grade-levels: 3.LS1.B ; 3.LS3.A ; HS.LS2.A	
Common Core State Standards Connections:	
<u>ELA/Literacy</u> –	
RST.6-8.1	Cite specific textual evidence to support analysis of science and technical texts. (MS-LS1-5)
RST.6-8.2	Determine the central ideas or conclusions of a text; provide an accurate summary of the text distinct from prior knowledge or opinions. (MS-LS1-5)
WHST.6-8.2	Write informative/explanatory texts to examine a topic and convey ideas, concepts, and information through the selection, organization, and analysis of relevant content. (MS-LS1-5)
WHST.6-8.9	Draw evidence from informational texts to support analysis, reflection, and research. (MS-LS1-5)
<u>Mathematics</u> –	
6.SP.A.2	Understand that a set of data collected to answer a statistical question has a distribution which can be described by its center, spread, and overall shape. (MS-LS1-5)
6.SP.B.4	Summarize numerical data sets in relation to their context. (MS-LS1-5)
Lesson Level Vocabulary: <i>starvation, dehydration, suffocation, predation, physical trait, criteria, constraints, behavioral trait, species</i>	
DCI Domain Vocabulary:	
Domains are bold:	
<ul style="list-style-type: none"> From Molecules to Organisms: Structure and Processes→Growth and Development of Organisms (LS1) <i>breed, diverse, transfer, development, attract, characteristics of life, germination, plant structure, plumage, reproductive system, soil fertility, vocalization, fertilizer, genetic, specialized</i> 	

Performance Expectation MS-LS3-2 Heredity: Inheritance and Variation of Traits		
<p><i>Students who demonstrate understanding can:</i></p> <p>Develop and use a model to describe why asexual reproduction results in offspring with identical genetic information and sexual reproduction results in offspring with genetic variation.</p> <p>Clarification Statement: Clarification Statement: Emphasis is on using models such as Punnett squares, diagrams, and simulations to describe the cause and effect relationship of gene transmission from parent(s) to offspring and resulting genetic variation.</p> <p>Assessment Boundary: N/A</p>		
<p>Lesson Level Photo Analysis: Some organisms like bacteria are identical to their parents, but some organisms like dogs are not.</p> <p><i>*note: all photo and video above links to suggested activities below</i></p>		
MS-LS3-2 Suggested Activities		MS-LS3-2 Recommended Formative Assessments
<p>Inheriting Genes (TCI: Cells and Genetics Unit 4, Lesson 9) Students will determine if a species reproduces asexually or sexually, by predicting the traits resulting from inherited genes. Students will model how alleles determine traits. Students will model how alleles and traits are inherited. (3-4 class periods)</p>		<ul style="list-style-type: none"> Explain trait variation between the offspring of asexually or sexually reproducing families. Label the boxes of a Punnett Square (given in TCI student notebook) using parent 1 alleles, parent 2 alleles, possible alleles of combinations of offspring.
Science and Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
<p>Developing and Using Models</p> <ul style="list-style-type: none"> Develop and use a model to describe phenomena. <p>Modeling in 6–8 builds on K–5 experiences and progresses to developing, using, and revising models to describe, test, and predict more abstract phenomena and design systems.</p>	<p>LS1.B: Growth and Development of Organisms</p> <ul style="list-style-type: none"> Organisms reproduce, either sexually or asexually, and transfer their genetic information to their offspring. (<i>secondary</i>) <p>LS3.A: Inheritance of Traits</p> <ul style="list-style-type: none"> Variations of inherited traits between parent and offspring arise from genetic differences that result from the subset of chromosomes (and therefore genes) inherited. <p>LS3.B: Variation of Traits</p> <ul style="list-style-type: none"> In sexually reproducing organisms, each parent contributes half of the genes acquired (at random) by the offspring. Individuals have two of each chromosome and hence two alleles of each gene, one acquired from each parent. These versions may be identical or may differ from each other. 	<p>Cause and Effect</p> <ul style="list-style-type: none"> Cause and effect relationships may be used to predict phenomena in natural systems.

Performance Expectation MS-LS3-2 Heredity: Inheritance and Variation of Traits	
Connections to other DCIs in Middle School: N/A	
Articulation of DCIs across grade-levels: 3.LS3.A ; 3.LS3.B ; HS.LS1.B ; HS.LS3.A ; HS.LS3.B	
Common Core State Standards Connections:	
<u>ELA/Literacy</u> -	
RST.6-8.1	Cite specific textual evidence to support analysis of science and technical texts. (MS-LS3-2)
RST.6-8.4	Determine the meaning of symbols, key terms, and other domain-specific words and phrases as they are used in a specific scientific or technical context relevant to grades 6-8 texts and topics. (MS-LS3-2)
RST.6-8.7	Integrate quantitative or technical information expressed in words in a text with a version of that information expressed visually (e.g., in a flowchart, diagram, model, graph, or table). (MS-LS3-2)
SL.8.5	Integrate multimedia and visual displays into presentations to clarify information, strengthen claims and evidence, and add interest. (MS-LS3-2)
<u>Mathematics</u>	
MP.4	Model with mathematics. (MS-LS3-2)
6.SP.B.5	Summarize numerical data sets in relation to their context. (MS-LS3-2)
Lesson Level Vocabulary: <i>asexual reproduction, sexual reproduction, genetic variation, random, probability, dominant allele, recessive allele, Punnett square</i>	
DCI Domain Vocabulary:
